DETAILED ACTION

Response to Arguments

1. Applicant's arguments, see pages 2-4, filed 12/29/2006, with respect to claim 4 have been fully considered and are persuasive. The rejection of claim 4 has been withdrawn.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claim 4 is rejected under 35 U.S.C. 102(e) as being anticipated by Shim et al. 6,332,924.

Shim et al. disclose a viscous material application apparatus (col. 1, ll. 4-7), which comprises a main body (24) having a pressurized chamber (80) for storing a viscous material, the pressurized chamber connecting through to a discharge port (50), a viscous material supply device (20) for transferring the viscous material under pressure to the pressurized chamber, a discharge pressure regulating device (100,48,76) for regulating a discharge pressure of the viscous material by increasing and decreasing a capacity of the pressurized chamber when the viscous material inside the pressurized chamber is pressurized and discharged (col. 3, ll. 9-67 onto col. 4, ll. 1-

Art Unit: 3754

57), wherein the discharge pressure regulating device includes an actuator (76), and a diaphragm (78) which is engaged by the actuator and which transforms under influence of the actuator and increases and decreases capacity inside the pressurized chamber.
